This project comes from the GitHub open source project. In order to adapt to the hardware, the source code has been simply modified. Original link: https://github.com/Scott-Cooper/Drawbot_image_to_gcode_v2

Basic usage method:

1. If the computer has not installed [*processing*], you need to unzip the compressed package first, run processing.exe, and open *BotDrawing.pde* in the *Drawbot_image_to_gcode_v2* folder in the software interface.
2. Click the *Run* button, select the picture to be processed in the pop-up dialog box, after the effect is displayed, press the key g to generate GCODE. Open the *gcode* folder under the *Drawbot_image_to_gcode_v2* folder, the *main.nc* inside is the generated GCODE code.
3. You can open [*Key Bindings.txt*] to view other key operations, but because this code has been modified, some operations are no longer supported.
